(Leningrad State University)). L. A. Govorova spoke about "The Errors of Interpolation of Gravity Anomalies and the Accuracy of Determining Gravimetric Deflections of the Vertical", B. A. Bryusov (MGU) about "Errors of the Representation and Interpolation of Gravitational Anomalies". S. N. Shcheglov reported on "Preliminary Results of Geodetic and Gravimetric Work in the Antarctica", Yu. N. Avsyuk on the "Structure of the Earth Crust in the Antarctica According to Seismo-gravitational Data", S. A. Ushakov on "The Structure of the Earth Crust in the Antarctica According to Gravimetric Data". P. S. Zakatov (MIIGAik) spoke about the "Preparation and Use of Gravimetric Experts". The recommendations given by the Conference are mentioned. From April 19 to 22, 1960 a Scientific and Technical Conference of the Workers of the Topographic-geodetic and the Surveying Service of the Glavnoye Upravleniye geologii i okhrany nedr pri Sovete Ministrov Ukrainskoy SSR (Main Administration of Geology and Preservation of Mineral Resources of the Council of Ministers Ukrainskaya SSR) was held in Artemovsk. There, the state of the topographic-geodetic and surveying work in the organizations of the Glavgeologiya USSR (Glavgeologiya UkrSSR) and the introduction of new

Card 4/6

Chronicle

S/006/60/000/008/001/001
B012/B051

techniques and technology in production were discussed. At the Conference it was stated that the extent of the work mentioned will be considerably increased within the next seven years. Furthermore, the following drawbacks were pointed out: The methods applied are too extensive and expensive, the geological organizations are insufficiently equipped with new apparatus; in geological observations the aero-photographs and topographic plans available on a large scale are not sufficiently used. This state is explained by inefficient technical direction, inefficient technical and material supply, by a lack of suitable direction in the Glavgeologiya UkrSSR and the Ministerstvo geologii i okhrany nedr SSSR (Ministry of Geology and Preservation of Mineral Resources of the USSR). Recommendations are given to improve this situation. For improving the qualifications of the workers the Conference suggested to convene scientific and technical conferences at regular intervals. For improving information and for the exchange of experience the editorial board of the present periodical was asked to furnish a section for topographic and geodetic work in geological observations. The participants in the Conference appealed to the workers

TOPIC TAGS: gravimetry, gravimeter, gravimetric analysis, aerial survey, data processing

TRANSLATION: The Aerogravimetric Laboratory of the Institute of the Physics of the Earth of the SSSR Academy of Sciences has developed a strongly damped gravimeter, based on the elastic properties of twisted quartz glass thread.¹⁵ The measurement of the force of gravity acceleration is made by the variation of the thread angle of twist. It is determined by the deflection angle of the pendulum. The instrument is used in naval gravimetry survey on submarines and surface ships, as well as for experimental work on aircraft. The time spent for processing of recordings, during which the effect of turbulent accelerations is excluded, significantly exceeded the time of observation. The special features and the conditions for automatic processing

Card 1/2

UDC: 528.27

L 32563-66

ACC NR: AR5014703

of gravimetric data were studied. By observation from low-speed submarine or surface vessels, the automatic computer has only to perform the operation of averaging the record for a given period of time. In observation from an airplane the functions of the computer are more complex. Computing slipping average values of gravimeter indications or the current values of integral from the function, which represents the motion of elastic system pendulum in time, can be considered as a preliminary problem in this case. The device transforming the movement of the gravimeter pendulum into an analogy or code system must have an accuracy of 2'.5. The most comprehensive way of taking readings is the method in which the measurement unit of the pendulum swing is the change of the distance between two blocks, reflected from the elastic system speculum. Other known methods (for example the volume one) will hardly secure the necessary accuracy. B.U.

TITLE:

A method for reducing the error in superposing the mirrors of the
ГA9 (GAE) gravimeter

PERIODICAL:

Referativnyy zhurnal, Astronomiya i Geodeziya, no. 8, 1962, 25,
abstract 8G214 ("Tr. In-ta fiz. Zemli AN SSSR", 1962, no. 24,
80 - 85)

TEXT:

The Institute of Physics of the Earth, AS USSR, has designed and constructed the working model of a photoelectronic attachment in order to increase the accuracy of reading g_r on GAE gravimeters. This attachment makes it possible to determine the superposition of blinks from the mobile and fixed mirrors of the elastic system on the galvanometer scale with an error of ~ 0.1 . To weaken the effect of pendulum vibrations in the elastic system, an integrating circuit is provided in the galvanometer circuit, which causes electric damping of the galvanometer pointer. The photoelectronic attachment is described, and test results under laboratory conditions are presented. In the range of 1,000 mgal the read-

TITLE: A marine gravimeter with photoelectric micrometer

SOURCE: AN SSSR. Institut fiziki Zemli. Apparatura i metody morskikh gravimetri-
cheskikh nablyudeni (Apparatus and methods of marine gravimetric observations).
Moscow, Izd-vo Nauka, 1965, 3-17

TOPIC TAGS: gravimeter, oceanic gravimeter, photoelectric micrometer

ABSTRACT: The authors describe the first model of an instrument they have develop-
ed for measuring gravity acceleration from a floating ship. The instrument is a
quartz gravimeter with liquid temperature compensation and a spring system based
on the elastic properties of twisted filaments. This system (the sensor for chang-
es in gravity acceleration) consists of a quartz frame to which a quartz
thread about 100 μ in diameter is fastened. A pendulum and mirror arrangement is
welded to the middle of the thread. The moment created by the pendulum twists the
thread through an angle of 300-500°. The spring system is housed in a square dura-

Card 1/4

L 14495-66

ACC NR: AT6006258

lumin box which contains blocks made of this same material: one with the quartz system and the other with a stationary mirror. Each block is mounted on the bottom of the box on three screws and is held to the bottom by a pair of springs. The screws are used for controlling the position of the blocks with respect to the housing. The top of the box is hermetically sealed with a cover containing a plane-parallel protective glass over the mirrors. Four screws projecting from this cover are used for fastening the framework of the optical system. Cylindrical plugs along the edges of the cover allow access to the adjustment screws. The range of the spring system is adjusted by one of these screws. The housing is filled with a viscous silicone liquid, which acts as a damper for natural oscillations of the pendulum and for vibrations caused by disturbing tilts and acceleration and also compensates for variations in the position of the pendulum caused by changes in the temperature of the system. A diagram of the instrument is shown in Fig. 1. An optical system with a photoelectric micrometer is used for measuring the angle between the mirrors. The galvanometer in the photomultiplier circuit is adjusted so that it gives a zero reading when the bright spot is completely covered by screen 7 and a full-scale reading when the bright spot is completely uncovered. Thus, the visible width of the spot is magnified to the dimensions of the galvanometer scale.

ABSTRACT: The vacuum tube computer developed by the Division of Experimental Gravimetry of the Institute of Physics of the Earth, AN USSR, for summing a predetermined number of ordinates, to be used with the marine gravimeter could only be used for laboratory investigations because its power requirements were too high for most field applications. The Division and the Institute's Electronic Automation Laboratory therefore joined forces to develop a semiconductor version of the same device, leaving the circuitry unchanged. The device has the following basic

ABSTRACT: Quartz resonators are widely used as timers for pendulum gravimetry observations. Since resonators must be maintained at a constant temperature in order to maintain the required accuracy, the curve of change in the temperature frequency coefficient is an extremely important parameter for stable resonator operation. A device for simultaneous testing of four resonators is described. It can be used to record temperature coefficient curves within temperature ranges between room temperature and 85°C for four resonators simultaneously. The minimum step in temperature change is approximately 0.1°C but any greater step is possible. This device

Card 1/2

ACC NR: AT7006528

can also be used to age resonators and to determine the rate of variation in resonator frequency. The device consists of a thermostat containing the resonators and the oscillator circuit elements which require constant temperatures. The various elements of the device are described in detail. Orig. art. has: 5 figures and 1 table.

around hydrothermal uranium-ore bodies and in the river deposits above them; to demonstrate the possibility, the role, and the place of geochemical methods in solving such problems; and to describe the results of work on the development of primary and secondary diffusion aureoles of uranium and its associated elements. In addition to their own work, the authors used data from A. G. Vetrov, N. A. Voroshilov, V. S. Golusov, O. D. Gorbunov, M. Ya. Par, V. M. Konstantinov, M. V. Kutenkov, L. T. Mishin, Ye. A. Sizov, and others. Most of the spectral and luminescent analyses were performed by L. F. Davydova, Yu. T. Donets, B. M. Yelovov, E. V. Mozolevskaya, and R. V. Timofeyeva.

Most widely used method for drilling is by means of
rotary drill. In this case, however, if too much
pressure is applied to the bit the bore is liable to
diverge from the vertical and go off at uncontrollable
angle. Therefore, author shows advantages of using
low bit pressure and suggests several methods to
secure this.

TITLE: All-Union Scientific and Technical Conference on the Electrical Equipment in Buildings and Outside Installations Liable to Explosions (Vsesoyuznoye nauchno-tekhnicheskoye soveshchaniye po elektrooborudovaniyu v zryvoopasnykh pomeshcheniy i naruzhnykh ustanovok)

PERIODICAL: Energeticheskiy Byulleten', 1958, Nr 7, pp 29-33 (USSR)

ABSTRACT: The conference was held from 14-19 April, 1958 in Stalino and was convened by the Gosplan SSSR (State Planning, USSR) jointly with the Nauchno-tekhnicheskoye obshchestvo energeticheskoy promyshlennosti (Scientific and Technical Society of the Power Industry), the Moskovskiy dom nauchno-tekhnicheskoy propagandy im. F.E. Dzerzhinskogo (Moscow House of Scientific and Technical Propaganda imeni F.E. Dzerzhinskiy), Gosudarstvennaya inspektsiya po promyshlennoy energetike i energonadzoru MES (State Inspection of Industrial Power and Power Supervision of the MES) and Institut Gipronisolektroshakht. A total of 590 people took part in the conference and 36 reports were read including: V.S. Tulin, "State and 1959-1965 Development Plan for Research Work, Construction Projects and Production of Explosion-Proof Electrical Equipment and the Problems of

Co-ordinating this Work"; V.Ye.Uleshchenko, Ya.M.Bol'sham,
I.I. Rakovich "The Requirements in Electrical Equipment for
Buildings Liable to Explosions"; representative of the Plants
KHEMZ, Elektrosila and imeni Kainin "Designing Single Series
of Hermetic Electric Motors"; P.F. Kovalev, "The Use of Elec-
tric Power in Gas and Dust Infested Buildings, and the Plan-
ning of Common Rules for Preparing Electrical Equipment for
Installations Liable to Explosions"; A.F. Pankrat'yev "Elec-
tric Motors for Buildings Liable to Explosions, According
to Foreign Data"; P.A. Kolodochka, "Transformer Sub-stations
Liable to Explosions"; N.N. Yudin, "Low Voltage Apparatus for
Mines and Factory Installations Liable to Explosions"; A.S.
Tsibarov, "High Tension Compartments for Buildings Liable to
Explosions"; L.A. Sal'tsevich and A.S. Zusman, "Electric Light-
ing Equipment for Buildings Liable to Explosions". The case
for explosion-proof electrical equipment in the oil and gas
industries was put forth by: V.Ye. Obrenskiy (Novokuybyshev
Oil Refinery), Ye.A. Venetsianov (Tsentroelektromontazh),
N.S. Movsesov (Glavelektromontazh), B.A. Delibash (Tsentro-

elektromontazh), M.F. Shidlovskiy (Giproneftezavod), V.V. Peyve (Giproneftezavod), P.I. Polikarpov (Syzran' Oil Refinery), A.Ya. Berg (Kuybyshev Oil Refinery) and A.A. Blekhman (Lengi-progaz). The work of investigatory organizations such as MakNII, VosNII, TsNII UPO and Gipronelektroshakht was summed up and the conference agreed that the electrical industry had failed in developing better explosion-proof equipment. Specific defects in machinery and installations, and also some improvements, are mentioned. The article lists proposals agreed on by the conference and intended for the guidance of plants of the electrical industry and research and experimental organizations during the 1959-1965 period.

TITLE: Professor S. A. Volotkovskiy

SOURCE: Elektrichestvo, no. 4, 1965, 94

TOPIC TAGS: electric engineering personnel, mining engineering

ABSTRACT: In this salute to Prof. Volotkovskiy on his 60th birthday, the dozen signers of the article state that he, as head of the department of electrification of mining operations and industrial enterprises of the Dnepropetrovsk mining institute, has been a leader in the electrification and modernization of mining processes. In the field since 1920, Sergey Andronikovich completed his studies in the Dnepropetrovsk mining institute. He worked in the institute from 1930-1941. He became a doctor of technical sciences and professor in 1950, while at the Sverdlovsk mining institute. He returned to the Dnepropetrovsk mining institute in 1959. A member of the party since 1927, he has published over 130 works. Orig. art. has: 1 figure.

TITLE: Experience gained in using the method of deep seismic probing for studying the structure of the Earth's crust in certain regions of Western Turkmenia. (Opyt primeneniya metoda glubinnogo seysmicheskogo zondirovaniya dlya izucheniya stroyeniya zemnoy kory nekotorykh rayonov zapadnoy Turkmenii).

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya Geofizicheskaya, 1957, No.7, pp. 874-894 + 4 plates. (USSR)

ABSTRACT: Special studies were made in 1952 of the structure with the depth of some regions of Western Turkmenia in conjunction with detailed investigation of the seismicity of Turkmenia. For this purpose a method of deep seismic sounding was used which was proposed by G. A. Gamburtsev and developed in the Geophysics Institute, Ac.Sc. U.S.S.R. (Geofizicheskiy Institut AN SSSR) under his leadership (Refs.1 and 2). The fundamental task of these investigations was to clarify the character of the deep boundaries of division in the region of grouping of the main geological structures which occur in the region under consideration. These structures include the mountain ridges Kopet-Dag, Bolshoy Balkhan, the Predkopetdagskiy bend and the Trans-Caspian lowland. Under "deep boundaries" the authors understand boundaries located

Experience gained in using the method of deep seismic probing for studying the structure of the Earth's crust in certain regions of Western Turkmenia. (Cont.)

at depths between 5 and several tens of km, the investigation of which is accessible by ordinary geological and geophysical prospecting methods. The work was carried out by the Geophysics Institute, Ac.Sc., U.S.S.R. and the Central Asian Trust (GLAVNEFTGEOFIZIKA) of the Ministry of the Oil Industry. It was assumed that in investigating the deep structure of the region certain problems will be solved relating to increasing the depth of possible seismic prospecting under the conditions pertaining in Turkmenia. The field observations as well as the interpretation of the results were carried out under the scientific guidance of G. A. Gamburtsev. In addition to the authors, a number of people from the Geophysics Institute participated in the field work. The technical chief was N. Ye. Fedoseyenko, the field work was carried out, under the supervision of M. A. Zayonchkovskiy, by E. I. Zelikman and S. A. Kulikov guided the work at the point of explosion. The chief engineer of SREDAZNEFTGEOFIZIKA, Yu. N. Godin participated in commenting on the plans of the work and interpretation of the results. The basic results obtained are described in

Card 2/5

this paper. The features are described of the seismic boundaries located at various depths and the corresponding strata of the paleozoic, granite, basalt and the subcrust layers. Schematic maps are given of the surfaces of the paleozoic stratum and of the thickness of the Earth's crust. The maximum thickness of the crust is in the Trans-Caspian Lowland (over 40 km), the minimum thickness (below 30 km) is at the Bolshoy Balkhan. The dimensions of the Earth's crust are compared with the depth of tremors of weak earthquakes recorded by means of high sensitivity stations KMIZ. It was found that the South Western regions of Turkmenia are favourable for recording distant explosions (100 to 250 km) which are applied for deep seismic sounding. Groups of waves were recorded which correspond to division boundaries within a wide range of depths, from prospected depths of 3 to 10 km to the depths of the basalt and the subcrust layers (20 to 45 km). It was found that by changing over to lower frequencies (10 to 20 c.p.s.) and utilising distant explosions it is possible to increase appreciably the depth of prospecting by the method of refracted waves. At

distances of 30 to 80 km from the point of explosion it is possible to study division boundaries located at depths of 3 to 10 km; by means of deep seismic sounding methods it is possible to record distant explosions produced not only in water reservoirs but also in wells. The character of the recordings indicates the complex seismo-geological structure of South Western Turkmenia in the entire range of depths. For elucidating the character of the behaviour of deep horizons, it is necessary to take into consideration the influence of the seismic boundaries located above them. For this purpose it is advisable to combine deep seismic sounding with the correlation method of refracted waves, described by Gamburtsev et alii (Ref.16). Comparison of the recordings of P^* and P waves made in Turkmenia with those obtained in Tyan'-Shan (Refs.6 and 7) indicate that the kinematic and dynamic features of the groups of waves are similar in both regions. The groups consist of a large number of individual waves due apparently to the complex structure of the layers in the Earth's crust. Elucidation of the nature of the successive waves in the groups is one

of the fundamental tasks of developing further the method of deep seismic sounding. Four seismic boundaries were detected in Turkmenia, the least deep one is that of the surface of the paleozoic foundation; the deeper ones are those of the granite, basalt and subcrust layers respectively. The characteristics of the individual boundaries are described in some detail. Comparison of the sections of deep seismological sounding with the depth of the foci of weak earth tremors recorded by KM13 stations indicate that the tremors of the fundamental groups of earthquakes are concentrated in the granite, in the basalt layer and in the lower boundary of this layer. There are 20 figures, 2 tables and 18 references, 16 of which are Slavic.

TITLE: The Structure of the Earth's Crust in the Pamir -Alay Zone According to the Data of Deep Seismic Sounding (Stroyeniye zemnoy kory v Pamiro-Alayskoy zone po dannym glubinnogo seysmicheskogo zondirovaniya)

PERIODICAL: Izvestiya Akademii Nauk SSSR, seriya geofizicheskaya, 1958, Nr 10, pp 1162-1180 (and 2 plates) (USSR)

ABSTRACT: Work on deep seismic sounding in the Pamir -Alay Zone was suggested by Academician G. A. Gamburtsev. It was carried out under his direction and was a continuation of geological and geophysical explorations which have recently been carried out by the Geophysical Institute of the Academy of Sciences of the USSR in seismically active regions of Middle Asia in order to study the physics of earthquakes. The work reported in this paper was carried out by an expedition which was directed by I. L. Nersesov and L. E. Aronov. The geological structure of various parts of the Pamir -Alay Zone has been studied previously and results

Card 1/3

SOV/49 -58-10-2/15

The Structure of the Earth's Crust in the Pamir-Alay Zone According to the Data of Deep Seismic Sounding

were reported in Refs.2-11. As a result of the present work it was established that the structure of the earth's crust in mountain regions may be investigated by deep seismic sounding.. General features of the structure of the earth's crust in some regions of Southern Tian Shan' and Northern Pamir were obtained. The Mohorovičić surface and the surface of the basalt layer in this region have similar trends and extend from North-East to South-West. The depth of the basalt layer is between 15 and 40 km and the depth of the Mohorovičić surface is between 45 and 70 km. The following regularities have been deduced from profiles of the earth's crust in the Pamir-Alay Zone:

- a) in the transition from platform regions to mountain regions a considerable increase in the thickness of the earth's crust was observed within the range 30-70 km;
- b) in mountain regions plutonic boundaries have complex profiles with depressions or elevations of 15 km or more, and inclinations up to 10-12°;

Card 2/3 c) in mountain regions differences have been found in the structure of the earth's crust between Hercynian and Alpine

SOV/49 -58-10-2/15

The Structure of the Earth's Crust in the Pamir-Alay Zone According to the Data of Deep Seismic Sounding

foldings. Thus in Northern and Southern Tian Shan' the basalt layer has a large thickness while in the Northern Pamir the granite layer has a large thickness. A comparison of seismic data obtained during the above expedition with gravitational data for a number of regions in Middle Asia has shown that the character of the gravitational field is governed mainly by the form and the position of the Mohorovičić surface. The basalt layer is important in connection with the origin of anomalies. The maximum (in the USSR) negative anomaly was found in Northern Pamir (-450 mgl). There are 2 tables, 14 figures and 32 references, of which 29 are Soviet, 2 are English and 1 is German.

AUTHOR: Tulina, Yu. V.

TITLE: Conference on deep seismic sounding

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Seriya geofizicheskaya, no. 5, 1961, 748-750

TEXT: A conference on deep seismic sounding (DSS) of the earth's crust was held at the Institut fiziki zemli AN SSSR (Institute of Physics of the Earth, AS USSR) [Abstractor's note: Subsequently abbreviated to IPE] between November 14 - 19, 1960. The Conference was convened by the IPE, by the Sovet razvedochnoy geofiziki pri Prezidiume AN SSSR (Council for Prospecting Geophysics of the Presidium of AS USSR), and by the Geofizicheskiy otel i Vsesoyuznyy institut geofizicheskikh metodov razvedki Ministerstva geologii i okhrany nedr SSSR (Geophysics Department and All-Union Institute for Geophysical Prospecting Methods, Ministry of Geology and Protection of Mineral Resources of the USSR). There were 190 participants representing 48 organizations, which included 21

Conference on deep seismic ...

where work on deep seismic sounding (DSS) is carried out. Thirty-six papers were presented at the Conference. The introductory paper dealing with the importance of DSS was presented by Corresponding Member of AS USSR, V.V. Belousov. The papers presented at the Conference can be divided into three groups, dealing with the following subjects: 1) Field observations and interpretation of primary DSS data; 2) nature of waves coming from great depths, as recorded in various parts of the Soviet Union, and their physical interpretation; 3) improvement of DSS apparatus. The first group included the following: A collective paper by workers at the IPE and at the VNIIGeofiziki (All-Union Scientific Research Institute of Geophysics) which dealt with the observational techniques and which was presented by Ye. I. Gal'perin; a paper of Ye. D. Tagay and N. P. Ivanova on recording waves reflected from deep-lying discontinuities; a paper of V. Z. Ryaboy and G. G. Shteynberg on the "RNP method" in its laboratory modification. The second group included papers on: Applications of DSS methods to various seismogeological structures which can be found in the USSR (I. V. Litvinenko, I. V. Pomerantseva, A.V. Yegorkin, K. Ye. Fomenko, A. A.

Card 2/6

Popov, B. S. and I. S. Vol'vovskiy, P. S. Veytsman, B. D. Trebukova, Yu. P. Neprochnov, R. M. Krakshina, T. L. Vasi'yeva, I. I. Davydova, I. P. Kosminskaya); extensive DSS data on waves in continental, oceanic and intermediate types of crustal structure (I. P. Kosminskaya); extensive DSS data on waves from different layers of the earth's crust (B. S. and I. I. Vol'vovskiy, I. V. Pomerantseva, I. V. Margot'yeva, A.V. Yegorkin); theoretical calculations dealing with DSS interpretation (A. S. Alekseyev); analysis of experimental data and calculations based on several models (A. M. Yepinat'yeva, A. G. Aver'yanov); crustal composition and geophysical problems which can be solved by means of DSS (Yu. N. Godin, who suggested that wave velocities should increase with depth and was supported in this by I. A. Rezanov). Yu. N. Godin was of the opinion that it is too early to use DSS methods on a wide scale. This viewpoint was criticized by B. B. Tal'virskiy, B. A. Petrushevskaya, I. P. Kosminskaya, V. V. Fedynskiy and others who stressed that DSS methods are ready for practical use, that DSS is also of theoretical importance and that both very detailed and less detailed large-scale DSS observations are needed ✓

S/049/61/000/005/012/013
D207/D306

(this last question was also dealt with by S. I. Subbotin, A. T. Donabedov, I. K. Tuyezov and others). The second group of papers included also work on the nature of waves, seismic discontinuities and crustal structure (A. M. Yepinat'yeva, Ye. M. Rudich, G. N. Pariyskaya, I. V. Litvinenko), on physical characteristics of the earth's crust under various conditions (M. P. Volarovich, F. M. Lyakhovitskiy), on theoretical investigations and calculations (A. S. Alekseyev, A. G. Aver'yanov), on comparison of seismic and gravimetric data on the crustal structure (R. M. Dement'skaya, N. K. Bulin, V. I. Shraybman), on observational techniques (M. A. Zayonchkovskiy), and on analysis of seismograms of earthquakes and strong explosions (S. I. Masarskiy, N. K. Bulin, Ye. M. Butovskaya, D. D. Sultanov). Unfortunately there were only a few papers in the third group dealing with the very urgent problem of improvement of DSS apparatus. Faults of DSS instruments and methods for improvement were discussed by A. N. Mozzhenko. S. I. Ivanov reported that a radioseismic station was constructed at VITR but its serious production has been postponed several times. Use of radio buoys in the Black Sea was reported by Yu. P. Nep-

Card 4/6

Conference on deep seismic ...

S/049/61/000/005/012/013
D207/D306

rochnov and G. N. Lunarskiy. V. S. Voyutskiy proposed an "accumulation method" as a means of improving the sensitivity of DSS instruments working on dry land. Several papers deal with general problems which are of interest in other geophysical prospecting methods: Dependence of the intensity and of the frequency spectrum of waves on the weight of an explosive charge (G. G. Mikhota), low-frequency seismic prospecting (L. L. Khudzinskiy), combination of several geophysical methods for the study of the crustal structure (R. M. Dementitskaya). The Conference recommended: 1) Continuation and extension of DSS work on dry land and at sea for determining the total thickness and the structure of the earth's crust as well as the thickness of the sedimentary layer; 2) improvement of experimental DSS techniques during the next 2 - 3 years by intensive work at the research institutes; 3) continuation and extension of work on dynamic characteristics of DSS waves, and on interpreting hodographs of refracted and reflected waves; 4) development of new DSS apparatus using the latest developments in electronic engineering and instrument construction; 5) collation, in the next 3 years, of all DSS data obtained during the last ten
